

3in1 CELL PHONE CASE

protects from

mobile radiation
data theft
breaks & scratches

EXTRACT OF CELL PHONE CASE MODELS

Simple to use

The eWall cell phone case contains two pockets. The front one attaches to the cell phone and reduces the radiation that reaches the body by up to 95%. If the cell phone is put in the rear case and closed, the signal will be cut off = radiation-free! The reception comes back as soon as the cell phone is taken back out. The cell phone case also protects the phone from breaks and scratches. RFID/NFC data protection: EC cards, bank cards, etc. placed in the rear pocket are protected from unnoticed data reading.

FINDING THE CORRECT SIZE

Place your cell phone here. The cell phone case should be 1.5 cm wider and 2 cm longer than your phone. The coloured edges show the size of the cell phone case, the coloured surfaces show the maximum size of the device going into the case. The orange surface is for the orange frame and the green surface is for the green frame. Note: Custom-made products can be made in all sizes.
